PETITION FOR RECONSIDERATION OF RESTRICTION REQUIREMENT

Appendix: Claims as Pending

1. (previous presented) A genetically engineered organism selected from the group consisting of bacteria and plants producing polyhydroxyalkanoate, the improvement comprising providing the organism with a transgene encoding an enzyme having the catalytic activity of 3-hydroxyacyl-ACP thioesterase so that medium chain length PHA accumulates.
2. (original) The organism of claim 1 further comprising one or more transgenes encoding enzymes having the catalytic activity of acyl-CoA synthetase or acyl CoA transferase.
3. (original) The organism of claim 2 wherein the acyl-CoA synthetase is 3-hydroxyacyl-CoA synthetase.
4. (withdrawn) The organism of claim 2 wherein the acyl-CoA synthetase is *alkK*.
5. (withdrawn) The organism of claim 2 or 3 further expressing a heterologous 3-hydroxyacyl-CoA synthetase activity.
6. (previously presented) The organism of claim 1 further expressing a heterologous 3-hydroxyacyl-CoA synthetase activity.
7. (withdrawn) The organism of claim 1 wherein the enzyme is modified to enhance expression in the genetically engineered organism.
8. (withdrawn) The organism of claim 1 expressing an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, medium chain length PHA synthase, and medium chain length 3-hydroxy fatty acid acyl CoA synthase, wherein the organism is a plant cell, plant tissue, or whole plant.

PETITION FOR RECONSIDERATION OF RESTRICTION REQUIREMENT

9. (withdrawn) The organism of claim 8 further expressing selectable marker genes, wherein the organism is a whole plant.
10. (withdrawn) The organism of claim 1 expressing an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, a PHA synthase that incorporates medium chain length hydroxy acids, and medium chain length 3-hydroxy fatty acid acyl CoA synthetase, wherein the organism is a bacteria.
11. (withdrawn) The organism of claim 8 wherein expression of the transgene is targeted to a tissue or organelle selected from the group consisting of seeds, leaf, plastids, and peroxisomes.
12. (withdrawn) The organism of claim 10 wherein the bacteria is *E. coli* and PHA accumulates within the bacteria.
13. (previously presented) A method of engineering a PHA biosynthetic pathway in a transgenic organism selected from the group consisting of bacteria and plants which produce polyhydroxyalkanoate, the improvement comprising providing the organism with a construct comprising a transgene encoding an enzyme having the catalytic activity of 3-hydroxyacyl-ACP thioesterase so that medium chain length PHA accumulates.
14. (original) The method of claim 13 wherein the construct further comprises one or more transgenes encoding enzymes having the catalytic activity of acyl-CoA synthetase or acyl CoA transferase.
15. (previously presented) The method of claim 14 wherein the construct comprises a transgene encoding a 3-hydroxy acyl-CoA synthetase.
16. (withdrawn) The method of claim 15 wherein the construct further comprises a transgene encoding a PHA synthase.

PETITION FOR RECONSIDERATION OF RESTRICTION REQUIREMENT

17. (withdrawn) The method of claim 16 wherein the organism is a plant.
18. (withdrawn) The method of claim 16 wherein the construct expresses an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, medium chain length PHA synthase, and medium chain length 3-hydroxy fatty acid acyl CoA synthase, wherein the organism is a plant cell, plant tissue, or whole plant.
19. (withdrawn) The method of claim 16 wherein the construct expresses an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, a PHA synthase that incorporates medium chain length hydroxy acids, and medium chain length 3-hydroxy fatty acid acyl CoA synthetase, wherein the organism is a bacteria.
20. (previously presented) A method of making PHA comprising growing a transgenic organism selected from the group consisting of bacteria and plants, the organism producing polyhydroxyalkanoate and expressing a transgene encoding an enzyme having the catalytic activity of 3-hydroxyacyl-ACP thioesterase.
21. (previously presented) The method of claim 20 wherein the organism further comprises one or more transgenes encoding enzymes having the catalytic activity of acyl-CoA synthetase or acyl CoA transferase.
22. (original) The method of claim 21 wherein the acyl-CoA synthetase is 3-hydroxyacyl-CoA synthetase.
23. (withdrawn) The method of claim 21 wherein the organism further express a PHA synthase.
24. (withdrawn) The method of claim 22 wherein the organism further express a PHA synthase.

PETITION FOR RECONSIDERATION OF RESTRICTION REQUIREMENT

25. (withdrawn) The method of claim 24 wherein the organism expresses an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, medium chain length PHA synthase, and medium chain length 3-hydroxy fatty acid acyl CoA synthase, wherein the organism is a plant cell, plant tissue, or whole plant.

26. (withdrawn) The method of claim 24 wherein the organism expresses an enzyme selected from the group consisting of 3-hydroxyacyl-ACP thioesterase, a PHA synthase that incorporates medium chain length hydroxy acids, and medium chain length 3-hydroxy fatty acid acyl CoA synthetase, wherein the organism is a bacteria.

27-28. (cancelled)

29. (withdrawn) The organism of claim 10 wherein the bacteria is *E. coli*, and wherein 3-hydroxy acids are secreted into the culture medium.
